Intune App Management with inforcer

Approve once. Deploy everywhere. Keep every application current across every tenant you manage.

- 1,300+ apps ready to deploy
- Multi-tenant targeting
- Zero packaging work

Intune is the foundation

Microsoft Intune is the endpoint management service built into Microsoft 365, allowing you to:

- Enroll and manage devices
- Enforce security and compliance rules
- Push applications to devices
- Remotely protect data within applications
- Block non-compliance devices from accessing data

Intune is included with **Microsoft 365 Business Premium and above**, so most of your customers already have it.

What is Intune App Management?

Intune App Management is a critical step in a holistic cyber security strategy, allowing admins to deploy, configure, secure, update, and monitor applications across employee devices. It allows you to manage the entire lifecycle of an app, from adding and assigning users to removing it when it is outdated.

inforcer builds straight on top. Apps are delivered through Intune and controlled by your Intune admins, but you deploy, update, and manage apps centrally through inforcer.

Why do you need Intune App Management?

Every endpoint and application presents risk, and you are accountable for all Microsoft and third-party apps on every device, in every tenant.

Sourcing, packaging, and testing install scripts for every app, in each tenant is time-consuming and expensive.

Source control is inconsistent. Third-party and agent-based deployments usually serve links rather than apps so changing this workflow can cause errors because no app exists at the point of request.

Intune is the foundation

Turn app requests, deployments, and updates into a repeatable process with inforcer.

Curated and validated catalog

Browse 1,300+ applications already sourced, packaged and tested for Intune by out app partner, Devicie. Subscribe to an app once and it is ready to target at any customer you manage.

Deployment in a couple of clicks

Choose the applications a customer needs, target multiple tenants at once, and let Intune handle delivery. No packaging work and no repeating the same steps in each tenant.

Updates while you sleep

New versions are packaged and published to the catalog as vendors release them, so customers stay current without anyone writing another script.

Make custom apps manageable

Upload custom app packages once per version, then set per-client install strings from a central view.

Productivity without sacrificing security

Users can self-serve approved apps from the Microsoft Company Portal without local admin rights. Tighter permissions, no hit to productivity.

App management designed for MSPs

Approve, deploy, update, and self-serve at flat-rate pricing, inside the platform you already use for multi-tenant management. Fewer tools, fewer agents, and one less line item to justify.

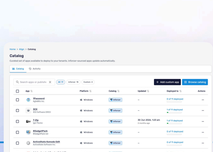

> “inforcer Intune App Management has transformed how we deliver and maintain applications across multiple customer tenants. By leveraging the application catalogue and centralized Intune deployment capabilities, we no longer need to build and maintain our own application deployment pipelines, allowing us to onboard new customers faster and ensure existing customers receive application updates in a consistent and scalable manner.”
